

DRIVE-IN

Drive In provides low investment, high density storage for users with very few SKU's to store. Drive In is limited in application because only a single SKU can be stored per bay and its storage utilization tends to be low due to honeycombing.

Advantages:

- Lower capital investment
- High storage density for certain product mixes

Typical Applications:

- Food or product manufacturers with limited SKU counts

Limitations:

- Inflexible, does not allow for SKU increase
- Low storage density (typically 50% of positions used)
- Low productivity (30% slower than alternative systems)
- Requires standardized pallets• High rack damage by forklifts
- LIFO - Last In First Out
- Difficult to rotate time sensitive products
